The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR camplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and cetermining the length of the resulting amplicon(8). Also described are: determining the length of the resulting amplicon(8). Also described are: concerpML; and prediagnosis (M3) of diseases associated With gene that includes one or prediagosition to a disease, associated With a prediagosition to concerpML. The method is used to identify microsatellite markers, in a include PML. The method is used to identify microsatellite markers, in a consease related gene, that are associated With a predisposition to disease and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, confirmed by less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the sheep prion contein (PrP) comprising a polymorphic microsatellite locus. genes that contain polymorphic microsatellite loci, useful for tying predisposition to disease, by amplification and determining Example 3; Page 30; 64pp; German length of amplicons.

Example 3; Page 30; 64pp; German.

The invention describes a method of typing (MI) a gene (I) that has one compared or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and cetermining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a cinclude PML. The method is used to identify microsatellite markers, in a disease and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, anilgnant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, comparising factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the sheep.prion cyntein (PrP) comprising a polymorphic microsatellite locus.

primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention factorides kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide Claim 1; Page 65; 83pp; English. acid sample.

assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNBs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.

Claim 6; Page 35; 52pp; English.

clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers of genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention The present invention relates to Simple Sequence Repeats (SSRs) from

Sequence 32 BP; 16 A; 10 C; 6 G; 0 T; 0 U; 0 Other;

Compounds that modulate the activity of a multiple lineage kinase protein treating a cell that contains MLK with a test compound and determining if the decreases or increases the activity of MLK and promotes cell survival or death. Compounds identified as having MLK modulating activity have applications as anti-neurodegenerative agents, antiinflammatory agents and anticancer agents and are potentially useful for treatment of neurodegenerative diseases (e.g. Alzheimer's, Huntington's and Parkinson's diseases, amyotrophic lateral sclerosis, ischaemia etc.) and amalignant cell growth. DLK was cloned for its use in pFLAG-DLK by using degenerate primers derived from the highly conserved VID and IX subdomains of PTK polypeptides. Two primers (AAZ93406, AAZ93407) were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying compounds that modulate multiple lineage.kinase proteins, useful e.g. for treating neurodegeneration or cancer, from their effect on survival or death of kinase-expressing cells.
                                                                                                                                                                                                   Multiple linkage kinase; MLK; PYK; modulation; antiinflammatory; anticancer; Alzheimer's disease; Huntington's disease; primer; Parkinson's disease; amyotrophic lateral sclerosis; ischaemia; ss

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New transgenic mice having a genetically modified fibroblast growth factor receptor gene, useful as a model for human chondrodysplasia, e.g. achondroplasia characterized by shortening of the limbs, midface hypoplasia or large skull.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an animal model for chondrodysplasia, more particularly, to a transgenic mouse model for achondroplasia. This transgenic mouse contains a fibroblast growth factor receptor 3 (FGFR3) encluding a G to A point mutation changing Gly to Arg in codon 380 in its genome. The transgenic mouse is useful as a model for FGFR-associated chondrodysplasia, particularly FGFR3 achondroplasia, e-g. shortening of the limbs, midface hypoplasia and large skull. This model may be exploited to gain better understanding of the disease and as an experimental model with which experimental therapy to chondrodysplasias can be exercised. The transgenic mouse is particularly useful as a tool for screening, developing and evaluating drugs with a potential of relieving or abolishing chondrodysplasia syndromes and/or symptoms. The present sequence is a PCR primer used to detect mouse FGFR3 allele
                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse; chondrodysplasia; achondroplasia; transgenic mouse; therapy; fibroblast growth factor receptor 3; FGFR3; limb; midface hypoplasia; large skull; drug screening; drug development; transgenic; PCR; primer;

                                                                                                                        A method for increasing the differentiation of undifferentiated central nervous system (CNS) cells in culture. This novel method involves culturing the cells in low ambient oxygen conditions. Differentiated CNS cells can be used to treat neurodegenerative diseases such as Parkinson's
                                                                                                                                                                                             disease. In order to determine the differentiated phenotype messenger RNA levels can be measured using reverse transcription PCR. This involves using PCR primers specific to certain genes. The present sequence is the reverse PCR primer used to monitor the message level of FGFR.
                                   Low oxygen culturing of central nervous system progenitor cells useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a PCR primer for the fibroblast growth factor receptor gene (PGPR3). It was used in reverse transcription PCR to determine expression patterns of the FGFR3 gene in cultured cells. These cells had been grown in low oxygen conditions, and had differentiated to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the differentiation of each type of neurone. The different cell types can be differentiation of each type of neurone. The different cell types can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for increasing the differentiation of undifferentiated central nervous system (CNS) cells in culture. This novel method involves culturing the cells in low ambient oxygen conditions. Differentiated CNS cells can be used to treat neurodegenerative diseases such as Parkinson's disease. In order to determine the differentiated phenotype messenger RNA levels can be measured using revorse transcription PCR. This involves using PCR primers specific to certain genes. The present sequence is the forward PCR primer used to monitor the message level of FGFR3.
                                                                                                                                                                                                                                                                                                                                                              Low oxygen culturing of central nervous system progenitor cells useful in

The present sequence is a PCR primer for the fibroblast growth factor receptor gene (FGFR3). It was used in reverse transcription PCR to determine expression patterns of the FGFR3 gene in cultured cells. These cells had been grown in low oxygen conditions, and had differentiated to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the used for tissue transplantation, to treat disorders such as stroke, brain and spinal cord injury, Alzheimer's disease, Huntington's disease, other neurodegenerative disorders, epilepsy, Parkinson's disease, neurological

The present invention relates to a method for identifying a genetic marker for spider lamb syndrome (SLS). The method comprising, obtaining a sheep DNA sample, and analysing the sample DNA with a probe to determine the presence or absence of a polymorphism in fibroblast growth factor receptor 3 (FGFR). The invention is used for diagnosing if sheep carry the gene for SLS, used to eliminate carriers of the syndrome from a flock. SLS or hereditary chondrodysplasia is a semi-lethal congenital disorder in sheep causing severe skeletal abnormalities. The present sequence is a PCR primer used to amplify sheep FGFR3 gene. The FGFR3 gene is located on chromosome 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to diagnose
                                                                                                                                                                                                           Sheep, spider lamb syndrome; SLS; fibroblast growth factor receptor 3; FGFR; hereditary chondrodysplasia; semi-lethal congenital disorder; severe skeletal abnormality; genetic marker; PCR primer; chromosome 6;

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (BS) cells, generating embryoid bodies (BB), culturing the bodies to select for central nervous system (CMS) precursor cells (PC), culturing PC in an expansion medium comprising a neurologic factor, and differentiating and culturing the expanded PC to form a culture of differentiated neuronal cells. The method is useful for reluting undifferentiated neuronal cells, The method is useful for culturing disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (NGP), brain derived neurorophic factor (BDNF), bFGF, glial derived growth factor (GNF) main derived neurotrophic factor (BDNF), bFGF, glial derived growth centrophic factor (BNF), bFGF, glial derived growth centrophic such as tyrosine hydroxylase, nerve growth factor (NGF), combject. The method is useful for culturing dopaminergic, cholinergic of for treating neurological disorders such as Hutington's disease, in the interval of the control of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alzheimer's disease, multiple solerosis, severe seizure disorders including epilepsy, familial dysautonomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders of mood and behavior such as addiction and schizophrenia, cerebrovascular disorders such as stroke and CNS disorders resulting from aging. Assays are useful for developing drugs capable of regulating the survival, proliferation or genesis of neuronal cells and to screen for antagonist or agonist of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dopamine or serotonin. Cell cultures comprising 50%-85% neurons which comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neurotransmitter synthesis and release, particularly for serotonin and dopamine, neuronal cell survival, and the electrophysicochemical properties of differentiated neuronal cells. Sequences ABIG762-721 represent gene specific PCR primers for CNS and dopaminergic specific regulatory genes, used for examining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.
                                                                                                                                                                                                                                                                                                                                                                                                                         dopaminergic; cholinergic; serotonergic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; tranquilizer; vulnerary; neuroleptic; cerebroprotective; cell therapy; gene therapy; CNS; PCR primer; ss.

Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.

Example 10; Page 41; 66pp; English.

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, generating embryoid bodies (EB), culturing the bodies to select for central nervous system (CNS) precureor cells (PC), culturing PC in an expanded PC to form a culture of differentiated neuronal cells. The method is useful for culturing undifferentiated neuronal cells. The method is useful for culturing undifferentiated ES cells to corn differentiated neuronal cells which are useful for treating a neurological disorder. especially Parkinson's disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (MGF), brain derived neurotrophic factor (BDNF), bFGF, glial derived growth factor. The method is useful for culturing dopaminergic, cholinergic and subject. The method is useful for culturing dopaminergic, cholinergic and subject. The method is useful for culturing dopaminergic, cholinergic for treating neuronal cells. The differentiated neuronal cells are useful for culturing dopaminergic, cholinergic and serotonergic neuronal disorders successive severe seizure disorders including epilepsy, familial dysautonomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders of mod and behavior such as addiction and schizophrenia, cerebrovascular disorders such as stroke and CNS disorders resulting from aging. Assays are useful for developing drugs capable of regulating the survival, proliferation or genesis of neuronal cells and to screen for antagonist or agonist of dopamine or serotonin. Cell cultures comprising 50%-85% neurons which

```
The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research
comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neurotransmitter synthesis and release, particularly for serotonin and dopamine, neuronal cell survival, and the electrophysiochemical properties of differentiated neuronal cells. Sequences AAI67692-721 represent gene-specific PCR primers for CNS and dopaminergic specific regulatory genes, used for examining the developmental progression of ES cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, antisense; fibroblast growth factor receptor 3; prophylaxis;

The present invention relates to a method of inducing differentiation of mammalian embryonic stem cells into functioning cells, which comprises culturing embryonic stem cells in a medium comprising leukaemia inhibitor culturing embryonic stem cells in a medium comprising leukaemia inhibitor factor and basic fibroblast growth factor. In particular, the invention carelates to the differentiation of murine embryonic stem cells. The method is useful for inducing differentiation of mammalian embryonic stem cells is useful for inducing discretes in pancreatic function, and in nerve function. Comparing the present comparing discretes in pancreatic function, and in nerve function. Comparing the present comparing the present comparing induced from embryonic stem cells using the present comparing may be used for treating disorders in pancreatic islet function (e.g. diabetes), neuronal degeneration (e.g. Alzheimer's disease and creuzfeldt-Jakob disease) or spinal cord disorders. The functioning cells are useful not only for cell transplant therapy, but for in vitro cells are useful ont only for cell transplant therapy, but for in vitro cells are useful or safety evaluation of new drugs. The present sequence is function, and for safety evaluation of the invention
                                                                                                                                                                                                                        ö
reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is human FGFR-3 DNA specific PCR probe. This probe is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing differentiation of mammalian embryonic stem (ES) cells into functioning cells, for treating e.g. diabetes, comprises culturing ES cells in a medium containing leukemia inhibitor factor and basic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NOYX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New NOVX polypeptide, useful for preparing a composition for treating or preventing e.g. cancer or for chromosome mapping.

```
The invention relates to a method for inducing differentiation of mammalian embryonic stem (ES) cells into functioning cells. The method is useful for inducing differentiation of mammalian ES cells into functioning cells. The pancreatic islet-like cell clusters induced from allogenic ES cells are useful for treating a mammalian patient having disorders in pancreatic islet function, such as when the patient is a type I diabetic patient. The nerve-like cells induced from allogenic ES cells can be used for treating a mammalian patient having disorders in nerve function. The method is a lso useful in cell therapy. The present sequence is a reverse transcription (RT)-PCR primer used to amplify mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing mammalian embryonic stem (ES) cell differentiation into functioning cells, for treating e.g. diabetes, by culturing mammalian ES cells in a medium having leukemia inhibitory factor and basic FGF to give
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fibroblast growth factor receptor (FGF 3R) cDNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                        Embryonic stem cell; ES cell; pancreatic islet-like cell; type I diabetis; nerve-like cell; nerve function; cell therapy; reverse transcription; RT; PCR; primer; mouse; ss; cell differentiation; fibroblast growth factor receptor; FGF 3R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

This protein is used in a method which assays the ability of a substance to bind to a high-affinity heparin-binding growth factor (HBGF) receptor. The assay screens for potential antitumour agents that inhibit binding of HBGF to high-affinity receptors, or for potential wound healing agents that promote such binding. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Assays for high-affinity heparin-binding growth factor receptor ligands -using receptor-overexpressing cells or cell-free system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Potassium channel alpha subunit; K+alphaMI; pathological condition; neuronal disorder; Addison's disease; male reproductive disorder; infertility; metabolic disorder; diabetes; cardiac disease; congestive heart failure; wound; human; single nucleotide polymorphism; SNP; K+alphaMI.v2; ds.

                                         The present invention relates to a new polymucleotide encoding potassium channel alpha subunit (KralphaM1) polypeptide. The KralphaM1 polymucleotides, polypeptides and antibodies are useful for diagnosing, preventing, treating or ameliorating a pathological condition or a susceptibility to a pathological condition such as neuronal disorders e.g. Addison's disease, male reproductive disorders e.g. infertility, metabolic disorders e.g. candidic disorders e.g. infertility, failure, or wounds. The present nucleic acid sequence represents a single nucleotide polymorphism (SNP) oligonuclocitde, as described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Potassium channel alpha subunit; K+alphaM1; pathological condition; neuronal disorder; Addison's disease; male reproductive disorder; infertility; metabolic disorder; diabetes; cardiac disease; congestive heart failure; wound; human; single nucleotide polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                        The present invention relates to a new polynucleotide encoding potassium channel alpha subunit (K+alphaM1) polypeptide. The K+alphaM1 polypeptide. The K+alphaM1 polynucleotides, polypeptides and antibodies are useful for diagnosing, preventing, treating or ameliorating a pathological condition or a susceptibility to a pathological condition such as neuronal disorders e.g. Addison's disease, male reproductive disorders e.g. infertility, metabolic disorders e.g. diabetes, cardiac diseases e.g. congestive heart failure, or wounds. The present nucleic acid sequence represents a single nucleotide polymorphism (SNP) oligonucloeitde, as described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide encoding a potassium channel alpha subunit polypeptide or its variants, useful for diagnosing, preventing or treating a pathological condition e.g. diabetes.

channel alpha subunit (K+alphaMI) polypeptide. The K+alphaMI polymucleotides, polypeptides and antibodies are useful for diagnosing, preventing, treating or ameliorating a pathological condition or a susceptibility to a pathological condition such as neuronal disorders e.g. Addison's disease, male reproductive disorders e.g. infertility, matabolic disorders e.g. diabetes, cardiac diseases e.g. congestive heart failure, or wounds. The present nucleic acid sequence represents a single nucleotide polymorphism (SNP) oligonucloeitde, as described in the
                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or

identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, lesch-Nyhan syndrome, muscular detrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptomes of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune configuration, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide configuration (SNPE) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the apportification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbol DNA fragments of between 250 and 500

co by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

co clones cross Hybridised. Assuming independent distribution of

co microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

microsatellites and mbol sites, the frequency of (T6)n >9 microsatellites

co rac. 230 such bovine microsatellites is summarised in the

specification and indexed herein (see below). The sequences upstream and

co specification and indexed herein (see below). The sequences upstream and

committee PCR primers for in vitro amplification of the corresp.

comparing the program OPTIPRIM). The microsatellites may be

microsatellite (using the program OPTIPRIM). The microsatellites may be

comparing of economic trait looi, or genes involved the determinism of

compaping of economic trait looi, or genes involved the determinism of

content of the microsatellite sep. in cattle, to allow selective
                                                                                                                                                                         ö
used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
con the sequence of (TC)15 and and (TC)15 olds one probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
con the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
constream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
consomically important trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
preeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree

                                                                                                                                                                                                The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonuclectide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprises signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylakylamino bridges. The present sequence is an OC used in the present invention
                                        Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human NADPH quinone oxidoreductase 2 (NQO2) polymorphic sequence #44.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.6%; Score 21.4; DB 1; Length 23; 95.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the human chromosomal clone SW13. The sequence is amplified by primers AAT66106-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), cytochrome P450 O2B1 (CYP4501A1), cytochrome P450 O2B1 (CYP4501A1), cytochrome P450 O2B1 (CYP4501A1), ddrenergic receptor beta1 (ADBR1), cytochrome P450 O2B1 (CYP4501A1), adrenergic receptor beta1 (ADBR1), cytochrome P450 O2B1 (CYP5), cytochrome
                      Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a

Natural resistance-associated macrophage protein; phage lambda 8.1; gene therapy; plasmid pBabe lambda 8.1; retro virus; therapy, ss.

WO9520044-A1 Synthetic RESULT 27 AAQ92938 ò g

```
The sequence of a poly(GT) sequence found in the promoter of the gene encoding the natural resistance-associated macrophage protein (NRAMP) from mice (AAQ92940) or humans. The NRAMP protein controls the response of macrophages to pathogenic microorganisms. The DNA sequence encoding the NRAMP was isolated and cloned into plasmid pBabe lambda 8.1 which can be used for gene transfer to haematopoietic cells, especially in vitro to bone marrow or progenitor cells, in cases of NRAMP deficiency such as cancer. The full-length murine DNA can be used to isolate the human

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MooI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MooI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be
                                                                                                   The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNa. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Moo! DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or genes involved the determinism of mapping of the contract of the corresp.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGFR-3. ACH, JT44 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is human exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            stem cell; dental follicle; tooth; membrane structure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for identifying a genetic marker for spider lamb syndrome (SLS). The method comprishing, obtaining a sheep DNA sample, and analysing the sample DNA with a probe to determine the presence or absence of a polymorphism in fibroblast growth factor receptor 3 (FGFR). The invention is used for diagnosing is sheep carry the gene for SLS used to eliminate carriers of the syndrome from a flock. SLS or hereditary chondrodysplasia is a semi-lethal congenital disorder in sheep causing severe skeletal abnormalities. The present sequence is a PCR primer used to amplify sheep FGFR3 gene. The FGFR3 gene is located on chromosome 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a genetic marker for spider lamb syndrome, used to diagnose if sheep carry a gene for the syndrome, involves analyzing sheep DNA samples for mutations in fibroblast growth factor receptor 3.
                                                                                                                                                                                                                                                                                                                                                                               Sheep; spider lamb syndrome; SLS; fibroblast growth factor receptor 3; FGFR; hereditary chondrodysplasia; semi-lethal congenital disorder; severe skeletal abnormality; genetic marker; PCR primer; chromosome 6;

                                                                                                                                                                                                                                                                                                                         The present invention describes a stem cell (A) that is obtained from non-embryonic tissue isolated from the dental follicle of a (wisdom) tooth which can differentiate in vitro into a membrane structure that resembles concluding the concluding and an invention of a stem cell (A1), derived from periodontal ligament. Also described: (I) a stem cell (A1), derived from con-embryonic or post-natal animal cells or tissue, that is capable of self-renewal and differentiation to cells of endo-, ecto- or meso-dermal concluding self-renewal and differentiation to cells of endo-, ecto- or meso-dermal concluding self-renewal and antiinflammatory activities, and can be used (A). (A) has osteopathic and antiinflammatory activities, and can be used differentiated from them, can be used to prevent or treat cellular differentiated from them, can be used to prevent or treat cellular. Confector, dysfunction and/or disease, e.g. tissue repair or transplantation. They can especially be used to rebuild periodontal crasses of periodonticis) or dental cementum, and to improve tissue (in cases of periodonticis) or dental cementum, and to improve tissue (in cases of periodonticis) or dental cementum, and to improve tissue (in cases) or seaffold, for growing teeth (or associated bone) or association with a scaffold, for growing teeth (or associated bone) or present sequence represents a PCR primer which is used in an example from

The present invention describes a stem cell (A) that is obtained from non-
cembryonic tissue isolated from the dental follicle of a (wisdom) tooth
which can differentiate in vitro into a membrane structure that resembles
cc which can differentiate in vitro into a membrane structure that resembles
cc periodontal ligament. Also described: (I) a stem cell (A1), derived from
cc non-embryonic or post-natal animal cells or tissue, that is capable of
cc non-embryonic or post-natal animal cells of endo-, ecto- or meso-dermal
cc self-renewal and differentiation to cells of endo-, ecto- or meso-dermal
cc lineages; and (2) pluripotent mesonchymal stem cells (A2) obtained from
lineages; and (2) pluripotent mesonchymal stem cells (A), and calls
cc in stem cell therapy, and in tissue replacement. (A), and cells
cc differentiated from them, can be used to prevent or treat cellular
cc differentiated from them, can be used to prevent or treat cellular
cc transplantation. They can especially be used to rebuild periodontal
cc transplantation. They can especially be used to rebuild periodontal
cc tissue (in cases of periodontitis) or dental cementum, and to improve
tissue (in cases of periodontitis) or dental cementum, and to improve
cc healing of tooth extraction or skin lesions. They can also be used in
association with a scaffold, for growing teeth (or associated bone) or
caterial/venous vessels in the mouth or as gene therapy carriers. The
component in the mouth or as gene therapy carriers. The
contraction of the contraction of the primer which is used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This primer and its 5' partner (AAG52727) correspond to regions highly conserved among mouse BEK, human FLG and chicken fibroblast growth factor
                                                                                                                                                                                     New NOVX polypeptide, useful for preparing a composition for treating or preventing e.g. cancer or for chromosome mapping.
                                                                                                                                                                                                                                                                                                            This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NoVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                  or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel isolated polypeptides and the DNA decences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NoVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the
                                                                                                                                                               Furtak K;
Spytek KA;
                                                                                                                                                                                                                                                                                                                                            New NOVX polypeptide, useful for preparing a composition for treating preventing e.g. cancer or for chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

acids (NAs) comprising contacting a sum-popuration in records acids (NAs) comprising contacting a sum-popuration physiological conditions to enzymatically generate sub-population of NAs, where each conditions to enzymatically generate sub-population of NAs, where each cach labeled NA is generated using a single gene specific primer. The each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for analysing the differences in the method comprises producing different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, comprising the population, where the comparison is preferably differences in the population, where the comparison is preferably differences in the population, where the comparison is preferably confidence by hybridising the labeled NAs for each of the distinct surface of a substract to produce a hybridisation pattern for each of the sources, where differential gene expression assays are utilised in differential expression analysis of diseased a normal tissue e.g. neoplastic a normal expression analysis of diseased a normal tissue e.g. neoplastic a normal expression analysis of the printed of the invention. Note: The sequence data for this patent did not form part of the printed peculic comparing in electronic format of free printed procession, but was obtained in electronic format directly from USPTO

sequences AAH40205 - AAH40944 represent PCR primers, single nucleotide primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the coligonucleotides are useful for genocyping a genotyping primer. SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genocyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to identity of a SNP and for genotyping nucleic acid samples, for e.g. to individuals, having pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. caused by one or more SNPs. Phenotypic traits include diseases e.g. osteogenesis imperfects and acute intermittent pophyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, conflammation, cancer, inervous system diseases and infection by machine confidence extension (SNPE) primer sequence represents a single nucleotide paternity analysis. The present sequence represents a single nucleotide sequence conflamence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAQ95132 and M13U are a pair of primers for the PCR amplification of AAQ84793, a new autosomal dominant spinocerebellar ataxia type 1 (SCA 1) mucleic acid. The nucleic acid and its protein product (AAR71111) can be used to develop products, for the presymptomatic detection of a SCA 1 disorder. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New autosomal dominant spinocerebellar ataxia type 1 nucleic acid - us to develop prods. for detection or presymptomatic diagnosis of a SCA1 disorder.

The invention relates to the ASTH1 locus on the short arm of human chromosome (11p). This locus comprises the ASTH11 and ASTH1J genes, which are associated with a genetic predisposition to asthma and bronchial hyperreactivity. The ASTH11 and ASTH1J genes are oriented in opposite directions with the ASTH11 and ASTH1J genes are oriented in opposite and rections with the ASTH1 locus, and have similar patterns of expression and common sequence motifs. They are both expressed in traches, lung and several other tissues. ASTH1I and ASTH1J are novel members of the ets activation of a variety of genes including the TCRs gene and cytokine cativation of a variety of genes including the TCRs gene and cytokine genes hnown to be important in the aeticlogy of asthma. Both ASTH1I and ASTH1J mRNAs are alternatively spliced. Alternative splicing of transcripts has no effect on the open reading frame of ASTH1J and ASTH1I manacripts has no effect on the open reading frame of ASTH1I and transcripts has no effect on the open reading frame of ASTH1I and excons involved are all 5' to the start codon in exon b. In contrast, alternative splicing of ASTH1I transcripts results in 3 different ASTH1I is softentifying expression of ASTH1I proteins are useful as diagnosetics to identifying appression of the gene in a biological specimen, and for genetating genetically modified non-human animals or site specific gene modifications that mimic or modulate activity or expression of ASTH1I cand/or ASTH1I genes or fragments thereof, enoroged proteins, and are allowed as therapeutic. The ASTH1 genes or fragments thereof, enoroged proteins, and therapeutic purposes in dividuals predisposed to development of asthma, and for modulation of gene activity in vivo for prophylactic and therapeutic purposes in the intent of asthma, and for modulation of gene activity in an absent of proteins or activity in the identification of individuals predisposed to bronchial hyperreactivity. Sequences ASTH1I or ASTH1I or ASTH1I or ASTH1I or ASTH1I or ASTH1I or ASTH2I o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gарв

The sequence is that of a bovine microsatellite sequence obtd. by

conservation a library of bovine Mbol DNA fragments of between 250 and 500

conservation and (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

conservation and (AC)15 oligonucleotide probe. One out of 50

conservation and Mbol sites, the frequency of (T6)n >9 microsatellites

microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites

conservation and indexed herein (see below). The sequence information

conservation and indexed herein (see below). The sequences upstream and

constream of the microsatellite sequence where used to generate the

constream of the microsatellite sequence was used to generate the

microsatellite (using the program OPTIPRIM). The microsatellites may be

microsatellity individuals, for parentage testing, and in the genetic

cused to identify individuals, for parentage testing, and in the genetic

conomically important traits esp. in cattle, to allow selective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAQ33675
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for the inspection of flat

c epithelial cells in which it is judged that flat epithelial cells

separated from an organism can proceed to flat epithelial cells

c 128th base in fibroblast growth factor receptor (FGFR) gene of the cells

c 128th base in fibroblast growth factor receptor (FGFR) gene of the cells

c is mutated from quanine to thymine. Also described is a method for

c screening treating or preventive agents for flat epithelial cancers in

c spapied to flat epithelial cancer cells producing FGFR protein in

which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from

c quanine to thymine or the 697th amino acid is mutated from glycine to

c quanine to thymine or the 697th amino acid is mutated from glycine to

c quanine to thymine or the 697th amino acid is whether for the

c quanine to thymine or the 697th amino acid is mutated from glycine to

c quanine to thymine or the 697th amino acid is mutated from glycine to

c quanine to thymine or the 697th amino acid is protein produced returned to glycine as the indices. The method is used

c the inspection of flat epithelial cells. The present sequence

for the inspection of flat epithelial cells. The present sequence

c represents a FGFR primer for human FGFR3, which is used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
con the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comparteem of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
concomically important trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN
                                                                             Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠ
                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 between 260 and 500 with an (AC15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at .910, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information for caulted PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTTRAIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. markers - used in genetic identification, gene Table 7; Page 327; 517pp; English. Polymorphic bovine DNA markers - mapping, and selective breeding.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the appecification and indexed herein (see below). The sequences upstram and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the construction of an oligonuclectide clamp. The clamp is a comb-type

branched polymer which has 3' termini and was used to bind a target sequence comprising a segment of the HIV pol and nef genes in single stranded or double stranded forms. An oligonucleotide clamp is a compound capable of forming a covalently closed macromolecule or a stable circular complex after specifically binding to the target polynucleotide.

Oligonucleotide clamps generally comprise one or more oligonucleotide moieties capable of specific binding to the target molecule and one or more pairs of binding moieties covalently linked to the oligonucleotide moieties. Upon annealing of the oligonucleotides moieties to the target polynucleotide, the binding moieties of a pair are bought into juxtaposition so that they form a stable covalent or non-covalent linkage to complex. The interaction of the binding moieties effectively clamps the specifically annealed oligonucleotide moieties to the target polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dG-dA), (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymorsase chain reaction; paternity; maternity; human; padigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in marchoals for selecting genes in chover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone MG25 which contains the repeat sequence having the formula: (AC)11. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and markers assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which
                                                                                                                                                                                                                                                                                                       Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human uridine diphosphate glucuronosyltransferase gene polymorphism #3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNs. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

Claim 8; Page 9; 13pp; English.

The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 131; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A2 (CYP4501A2), cytochrome P450 A2 (CYP4501A2), attachrome P450 O2E1 (CYP45002E1), adrenergic receptor betal (ADBR1), aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator arkley and acatepaths S (CTSS), cyclooxyenaes 2 (CCX2), diazespam binding inhibitor (DB1), epoxide hydrocylane 2 (EPHX2), 5-lipoxygenae activating protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl

(MRD1), orphan nuclear receptor (NHZ12), or acetylcholine muscarinic creeptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2), CHMR3, CHMR4 or CHMR5) sequence. Creeptor 1. 1 in Kage markers for locating and characterising the genes that genes responsible for a variety of disorder-related correction are responsible for specific traits within the genome and eventually care responsible for their e.g., overexpression, constitutive correction or underexpression, which may be used in diagnosing and/or treating the disorders. The nucleic acid molecules comprising the golymorphic sequences contained in CYP4501A1, CYPP4501A2, CARNY, EPHX2, GST12, NNMT, NOO2, NRI12, STM, UGT2B4, UGT2B15, AHR, MDR1 and/or MDR3 are useful for screening individuals for acted to screen for altered cardiovascular function, in COX2 for altered central cused to screen for altered cardiovascular function, in COX2 for altered cuscoptibility to colorectal tumours, in DBI or CHMR1 for altered serine concerned tumours, in DBI or CHMR1 for altered serine immunological tunction, in CHMR3, CHMR4 or CHMR3 for altered central and concerned tumours, in LTF for altered immunological or haematological function, in CHMR3, CHMR4 or CHMR3 for altered series and concerned to altered series and concerned tumours, in LTF for altered series and concerned tumours and concerned tumours of the invention many concerned to the invention of the invention many concerned to the invention of the invention or concerned 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR captemplate a DNA semple one DNA region of (I) that includes PML, using a template a DNA semple containing at least one segment of (I); and cast template a DNA semple containing at least one segment of (I); and cast template a DNA semple containing at least one segment of (I); and cast template a DNA semple containing (M2) microsatellite markers (MM) for a method of determining (M2) microsatellite markers (MM) for a method of datase, associated with a gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a predisposition to disease and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and methods at a such diseases, and because that encode milk proteins, malignant hyperthermia syndrome; quicker and barmones or transcription factors. The method is simpler, quicker and contains a prion protein polymorphic microsatellite marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hyping genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining
Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the leagth of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML, and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the sheep prion protein (PrP) comprising a polymorphic microsatellite locus. The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter. Human uridine diphosphate glucuronosyltransferase gene polymorphism #4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
are glucuronidated by UGT. The present DNA sequence represents a UGT gene

The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                             Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.5%; Score 20.4; DB 1; Length 26; 95.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidiahe-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human uridine diphosphate glucuronosyltransferase gene polymorphism #5.
                                                                                                                                          Human uridine diphosphate glucuronosyltransferase gene polymorphism #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; polymorphism; TA repeat; ds; UGT; thymidine-adenine repeat;

                                                                                                                          (DDN) molecule, ODN 21, including decoyuridine monophosphates. The invention is based on the discovery that ODNs containing decoyuridine residues (U-ODNs) have an immunostimulatory effect comparable to, or innumbers (U-ODNs) have an immunostimulatory effect comparable to, or innumbers of specific T cells to a given antigen. The U-ODNs do not induce the systemic production of pro-inflammatory cytokines and, in contrast to CQG ODNs, are not dependent on a specific motif or a palindromic sequence. Use of a U-ODN for the preparation of a vaccine is claimed. Combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of a specific immune response against a melanoma-derived peptide (see
                                                                                                                  The present sequence is that of a thiosubstituted oligodeoxynucleic acid

The present sequence is that of a thiosubstituted oligodeoxynucleic acid (ODN) molecule, ODN 21, including deoxyuridine monophosphates. The invention is based on the discovery that ODNs containing deoxyuridine residues (U-ODNs) have an immunostimulatory effect comparable to, or in many instances greater than, ODNs containing CpG motifs, producing higher the systemic production of pro-inflammatory cytokines and, in contrast to CpG ODNs, are not dependent on a specific motif or a palindromic CpG ODNs, are not dependent on a specific motif or a palindromic Combining the U-ODN for the preparation of a vaccine is claimed. Combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of a specific immune response against a melanoma-derived peptide (see

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human uridine diphosphate glucuronosyltransferase gene polymorphism #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, polymorphism, TA repeat, ds, UGT, thymidine-adenine repeat,

The present invention relates to identifying a rice variety as amplification genetic marker and identifying whether test rice variety is any one of the 32 rice varieties e.g., Kasalath, breath which came or Alayamasari, Italica Livorno, Dunghan Shali, Arroz Da Terra, Fany, USSR22, Nihonbare. The method is useful for identifying rice variety and identifies excellent rice variety. The present sequence represents a base containing SSR sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying rice variety using base sequence containing SSR sequence and amplifying genetic marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          / Match 0.5%; Score 20.4; DB 1; Length 28; Local Similarity 95.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug decages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

ö The present invention relates to identifying a rice variety as amplification genetic marker and identifying whether test rice variety is any one of the 32 rice varieties e.g., Kasalath, breath which came or Hayamasari, Italica Livorno, Dunghan Shali, Arroz Da Terra, Fany, USSR22, Nihombare. The method is useful for identifying rice variety and identifies excellent rice variety. The present sequence represents a base containing SSR sequence of the invention. New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene. WPI; 2003-567953/53.

Claim 1; SEQ ID NO 58580; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mesmatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises

nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at segdata.uspto.goc/sequence.html hybridising at least one or more nucleic acids to at least two or more

Determining whether the subject has or is predisposed to developing a disease or condition that is associated with an IL-1 inflammatory haplotype, useful for treating inflammation, comprises detecting an IL-1 allele

Claim 18; Fig 10A; 96pp; English.

c. This invention relates to the identification and use of general including the structure and organisation of movel IL-1 like genes found within the the structure and organisation of movel IL-1 like genes found within the the structure and organisation of movel IL-1 like genes found within the IL-1 locus as well as polymorphisms (single nucleotide polymorphisms; C. SNPs) and associated haplotypes within these genes. The invention also relates to the use of these polymorphisms and haplotypes for predicting including the structure and specificated to the use of these polymorphisms and haplotypes for predicting inflammatory disease) and for treating IL-1 associated inflammatory phenotypes. IL-1 is a primary inflammatory cytokine and has been implicated in mediating both acute and chronic pathological inflammatory completed in mediating both acute and chronic pathological inflammatory completed in mediating molecules, IL-1 alpha and IL-1 beta, are encoded by genes ILhA and ILIBA, an anti-inflammatory non-encodes IL-1 receptor antagonist (IL-1RA), an anti-inflammatory non-encodes IL-1 ceceptor antagonist (IL-1RA), an anti-inflammatory non-encodes IL-1 alpha and IL-1 gene cluster is on the long arm of chromosome (IL-1RA may have antiinflammatory, antiarthritic, hepatotropic or of proteins may be useful for gene therapy. The methods and polymucleotide proteins may be useful for gene therapy. The methods and polymucleotide proteins may be useful for diagnosing and treating an inflammatory chicageses, for example arthritis, hepatic inflammation, chronic obstructive in the and including a single nucleotide polymorphism of the including a single nucleotide polymorphism of the including and including a single nucleotide polymorphism of the including and including a single nucleotide polymorphism of the including and including a single nucleotide polymorphism of the including and including a single nucleotide polymorphism of the including and including a single nucleotide polymorphism of the including and present sequences This invention relates to the identification and use of genetic invention in the human ILIRN gene. 8888888888888888888888888888888

Immortalised human hair papila cells used for evaluation of hair growth agent - are prepared by transformation of human hair papila cells with gene with deleted replication initiation point.

Example 2; Page 7; 23pp; Japanese.

The specification describes the preparation of immortalized human hair papila cells (HPC). The method comprises transformation of HPC with an SV40 viral Large T-antigen gene with deleted replication initiation

The pharmaceutical preparations comprising agents which inhibit the synthesis and expression of FGFR3 and so have an anti-proliferation effect on carcinomas can be used to treat cancer. Two primers (AAA54426, AAA5438) were used in PCR reactions on urine samples to detect the S249C mutation in FGFR3
point. The immortalized HPC can be used in a screening method for a hair growth agent, by culture of immortalized HPC in the presence of a substance to be rested and observation of the growth of the immortalized HPC. HPC is also used in development of hair growth stimulating agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing carcinoma e.g. bladder or cervix carcinomas in a biological sample such as tissue, bone marrow or body fluid, preferably from animal or human, by identifying fibroblast growth factor receptor 3 mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fibroblast growth factor 3 receptor; FGFR3; mutant; detection; cancer; carcinoma; lung cancer; breast cancer; colon cancer; skin cancer; bladder; cervix; human; primer; 88.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of coloractal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JUTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense compounds targetted to a nucleic acid
hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human PGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, antisense, fibroblast growth factor receptor 3; prophylaxis;

molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR.3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR.3 such as developmental disorders or conditions. hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                            ö

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JUK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breach or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "Phosphorothioate backbone, All cytidine residues

                                                                                                                                                                                                                                                                   ö
                                                                         The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1. .20

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (PGF) receptor 3 (also known as FGRR-3, ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGRR-3 such as developmental disorders or the hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, broadents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to chucidate expression in differential and/or combinatorial analyses to chucidate expression. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                   The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRP-3) ACH, JTK4 and CRK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGRP-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGPR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRE-3) ACH, TYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophlylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRF-3, ACH, TYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, crevical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER

8 ద THE FITTH FI

```
The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3. ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, broagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues of antisense oligonucleotide targetted to human FGFR-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, antisense; fibroblast growth factor receptor 3; prophylaxis;

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues.
                                                                                                                                                                                                  /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGFR-3, ACH, TVK4 and CBK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of coloractal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                   /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRR-3, ACH, VITK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative for solving they are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3

                                                      The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGRR-3 such as developmental disorders or the hyperprise of coloredtal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to chucidate expression in differentian and/or combinatorial analyses to chucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGPR-3, ACH, TYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues.
                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or
                                                                                                                                                                                                                                                                                                      /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CTK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder,
